

## WHAT'S NEW

Unicoil, a new Australian innovation that allows the user to create any moulded 5/8" heater hose in seconds.

The Unicoil product offers to the automotive industry the benefits of only having to carry two product lines, replacing over 92% of all pre-moulded 5/8" heater hoses.

"One of the aims of the product is to simplify and increase sales for re-sellers and workshop repairers by offering a quality manufactured product to their clients that can be used in many applications", said Tony Woods and Peter Matthews of Advantage Auto Parts S.A.

"This is a product which will revolutionise the hose industry. The versatility of the product, coupled with the competitive price, is the reason why people are choosing to save time and money by using Unicoil."

Major distributors including Bursons, Coventry Auto Parts, Restorers Hotline, Motor Traders, Repco and many more leading parts suppliers have been quick to take up the sale and promotion of this new and innovative product and are eager with anticipated sales. Unicoils are manufactured with marine grade stainless steel. The Unicoil consists of a coil and a bendable spine that is welded to the coil. By simple positioning the Unicoil on the straight hose and by using hand pressure to bend the spine you can form almost any moulded hose in seconds. The spine holds the newly moulded hose in shape and the task of the coil is to prevent the hose from collapsing or kinking. Multiple coils can be used where more than one bend on a hose is required.

# A New Australian Innovation Unicoil Revolutionising Pre Moulded Hoses

Unicoil is currently available in two separate 5/8" product lines (2-bend & 3-bend packs). Both packs come supplied with Unicoils and a length of Gates charter heater hose that has been tolerance tested to ensure the correct quality and compatibility between the hose and the Unicoil is kept precise. In response to customer demand, our research team are currently developing a larger product range and will soon introduce different sizes of Unicoil kits for not only coolant transfer applications but also for the conveyance of petroleum based products.
